12 Simultaneous TX SAR Considerations

12.1 Introduction

The following procedures adopted from "FCC SAR Considerations for Cell Phones with Multiple Transmitters" are applicable to handsets with built-in unlicensed transmitters such as 802.11 a/b/g and Bluetooth devices which may simultaneously transmit with the licensed transmitter. For this device, the BT and Wi-Fi can transmit simultaneous with other transmitters.

12.2 Transmit Antenna Separation Distances

Picture 12.1 Antenna Locations

12.3 SAR Measurement Positions

According to the KDB941225 D06 Hot Spot SAR, the edges with less than 2.5 cm distance to the antennas need to be tested for SAR.

| SAR measurement positions | | | | | | | | | |
|---|-----|-----|-----|-----|----|-----|--|--|--|
| Mode Front Rear Left edge Right edge Top edge Bottom edge | | | | | | | | | |
| Main antenna | Yes | Yes | Yes | Yes | No | Yes | | | |
| WLAN Yes Yes No Yes Yes No | | | | | | | | | |

12.4 Standalone SAR Test Exclusion Considerations

Standalone 1-g head or body SAR evaluation by measurement or numerical simulation is not required when the corresponding SAR Exclusion Threshold condition, listed below, is satisfied. The 1-g SAR test exclusion threshold for 100 MHz to 6 GHz at test separation distances≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] $\cdot [\sqrt{f(GHz)}] \le 3.0$ for 1-g SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

Table 12.1: Standalone SAR test exclusion considerations

| Band/Mode | F(GHz) Position | | SAR test exclusion | RF output power | | SAR test exclusion |
|-------------|-----------------|------|--------------------|-----------------|-------|--------------------|
| | | | threshold(mW) | dBm | mW | |
| Pluotooth | 2.441 | Head | 9.60 | 9.5 | 8.9 | Yes |
| Bluetooth | 2.441 | Body | 19.20 | 9.5 | 8.9 | Yes |
| 2.4GHz WLAN | 2.45 | Head | 9.58 | 19 | 79.43 | No |

^{[1] -} Estimated SAR for Bluetooth (see the table 13.3)

Table 13.3: Estimated SAR for Bluetooth

| Mode/Band | E (CU-) | Position | Distance | Upper limit | Estimated _{1g} | | |
|-------------|---------|----------|----------|-------------|-------------------------|--------|--|
| Wiode/Barid | F (GHz) | Position | (mm) | dBm | mW | (W/kg) | |
| Bluetooth | 2.441 | Head | 5 | 9.5 | 8.9 | 0.37 | |
| Bluetooth | 2.441 | Body | 10 | 9.5 | 8.9 | 0.19 | |

^{* -} Maximum possible output power declared by manufacturer

When standalone SAR test exclusion applies to an antenna that transmits simultaneously with other antennas, the standalone SAR must be estimated according to following to determine simultaneous transmission SAR test exclusion:

(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]·[$\sqrt{f(GHz)/x}$] W/kg for test separation distances \leq 50 mm; where x = 7.5 for 1-g SAR.

When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion

Conclusion:

According to the above tables, the sum of reported SAR values is<1.6W/kg. So the simultaneous transmission SAR with volume scans is not required.

14 SAR Test Result

It is determined by user manual for the distance between the EUT and the phantom bottom. The distance is 10 mm and just applied to the condition of body worn accessory.

It is performed for all SAR measurements with area scan based 1-g SAR estimation (Fast SAR). A zoom scan measurement is added when the estimated 1-g SAR is the highest measured SAR in each exposure configuration, wireless mode and frequency band combination or more than 1.2W/kg.

The calculated SAR is obtained by the following formula:

Reported SAR = Measured SAR $\times 10^{(P_{Target}-P_{Measured})/10}$

Where P_{Target} is the power of manufacturing upper limit;

P_{Measured} is the measured power in chapter 11.

14.3 WLAN Evaluation for 2.4G

According to the KDB248227 D01, SAR is measured for 2.4GHz 802.11b DSSS using the <u>initial</u> test position procedure.

Head Evaluation

Table 14.3-1: SAR Values (WLAN - Head) – 802.11b (Fast SAR)

As shown above table, the <u>initial test position</u> for head is "Left Touch". So the head SAR of WLAN is presented as below:

Table 14.3-2: SAR Values (WLAN - Head) – 802.11b (Full SAR)

| 2462 | 11 | Left | Tilt | / | 18.66 | 19 | 0.532 | 0.58 | 0.258 | 0.28 | 0.12 |

Note1: When the <u>reported</u> SAR of the <u>initial test position</u> is > 0.4 W/kg, SAR is repeated for the 802.11 transmission mode configuration tested in the <u>initial test position</u> using subsequent highest estimated 1-g SAR conditions determined by area scans, on the highest maximum output power channel, until the <u>reported</u> SAR is \leq 0.8 W/kg. Note2: For all positions/configurations tested using the <u>initial test position</u> and subsequent test positions, when the <u>reported</u> SAR is > 0.8 W/kg, SAR is measured for these test positions/configurations on the subsequent next highest measured output power channel until the <u>reported</u> SAR is \leq 1.2 W/kg or all required channels are tested.

According to the KDB248227 D01, The reported SAR must be scaled to 100% transmission duty factor to determine compliance at the maximum tune-up tolerance limit. The scaled reported SAR is presented as below.

Table 14.3-3: SAR Values (WLAN - Head) - 802.11b (Scaled Reported SAR)

SAR is not required for OFDM because the 802.11b adjusted SAR ≤ 1.2 W/kg.
